

Ensuring Road And Pedestrian Safety Through the Use Of Computer Vision and Data Fusion

Graduate Researcher: Domitille Commun

Committee members: Jeffrey T. Hunnicutt (GTPD), Prof. Dimitri Mavris (GT AE/ASDL), Dr. Michael Balchanos and Dr. Olivia Pinon Fischer (GT AE/ASDL)

MOTIVATION

- 137,000 pedestrians injured in traffic accidents in the USA in 2017 [1]
- Increased threat for pedestrian safety on the Georgia Tech campus:
 - Population growth on campus with a constant infrastructure size: population increased by 48% between 2012 and 2018: Additional traffic and pedestrian flow on campus
 - Emerging modes of transportation (scooters) and potential distractions for walkers

PROBLEM FORMULATION

Problem: Currently certain incidents are not reported. Incident reports are manually produced, which is tied to a labor-intensive process to analyze data and understand the needs for potential measures to improve safety

Objective: Describe, detect and quantify the frequency of high-risk behaviors and near-accidents involving pedestrians, in order to explore countermeasures to improve pedestrian safety

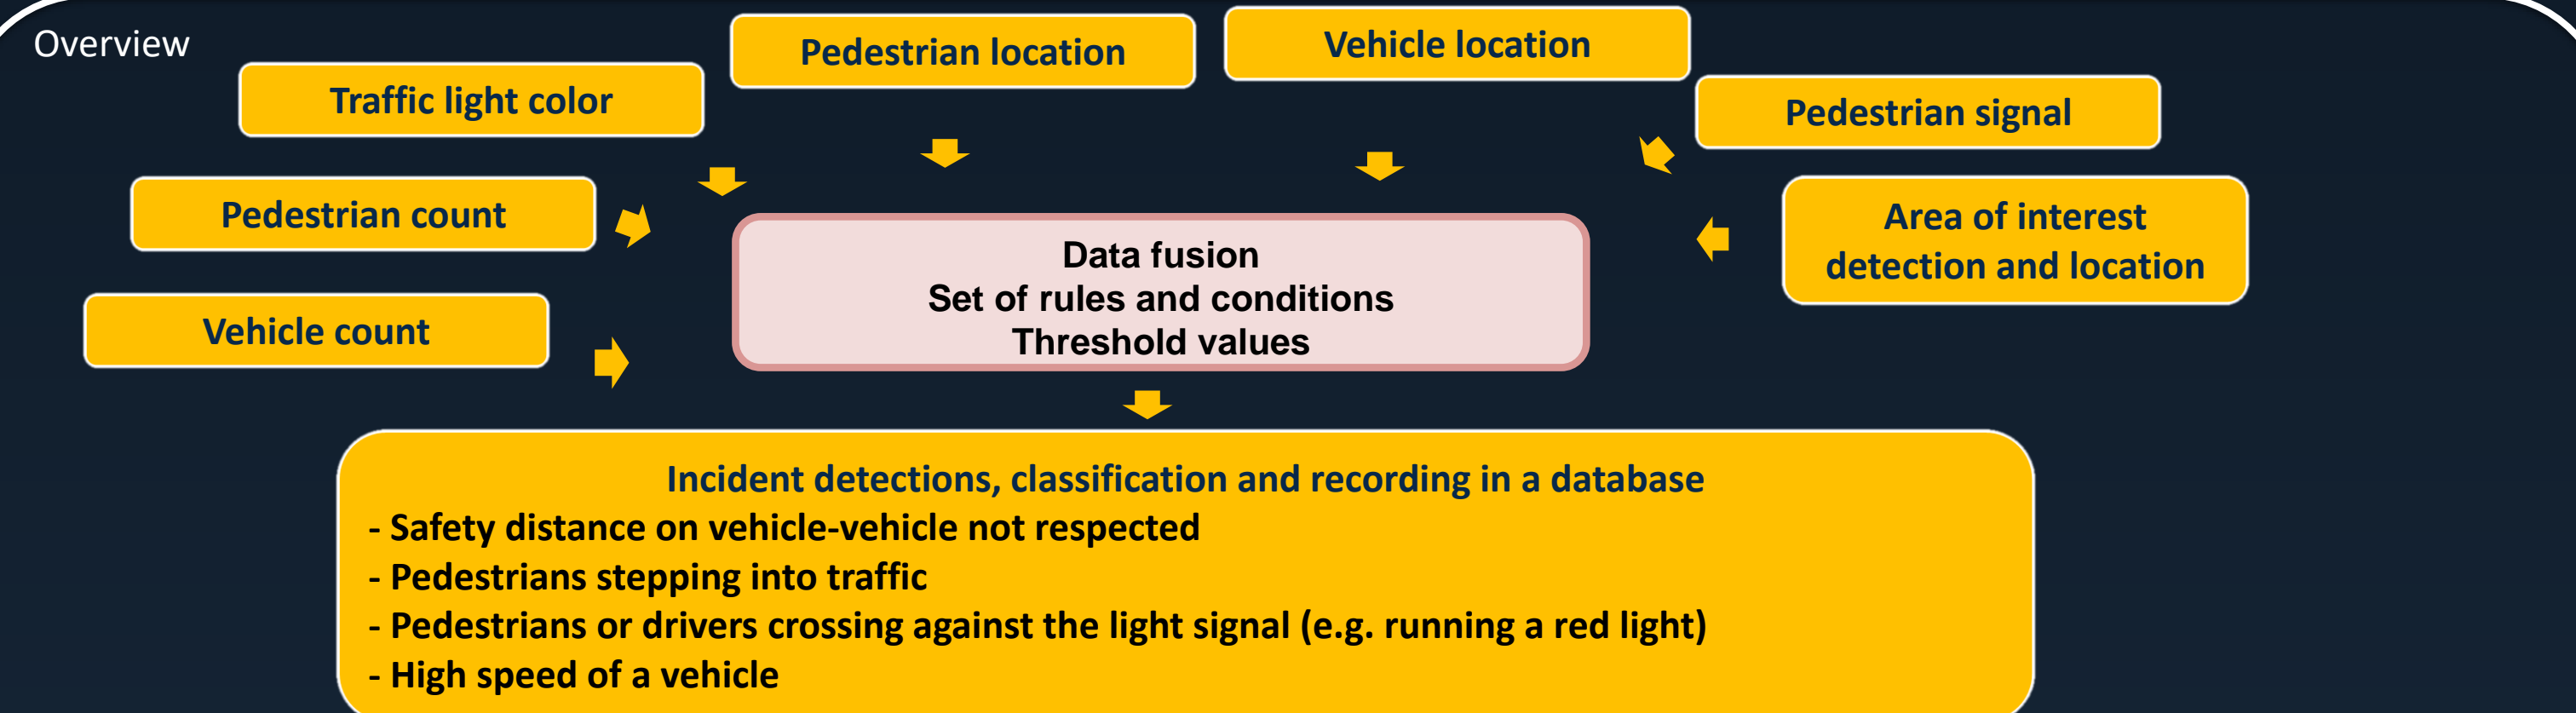

Constraint: Ensure privacy protocols are respected (anonymized data only)

AUTOMATED PEDESTRIAN AND TRAFFIC DATA COLLECTION THROUGH COMPUTER VISION

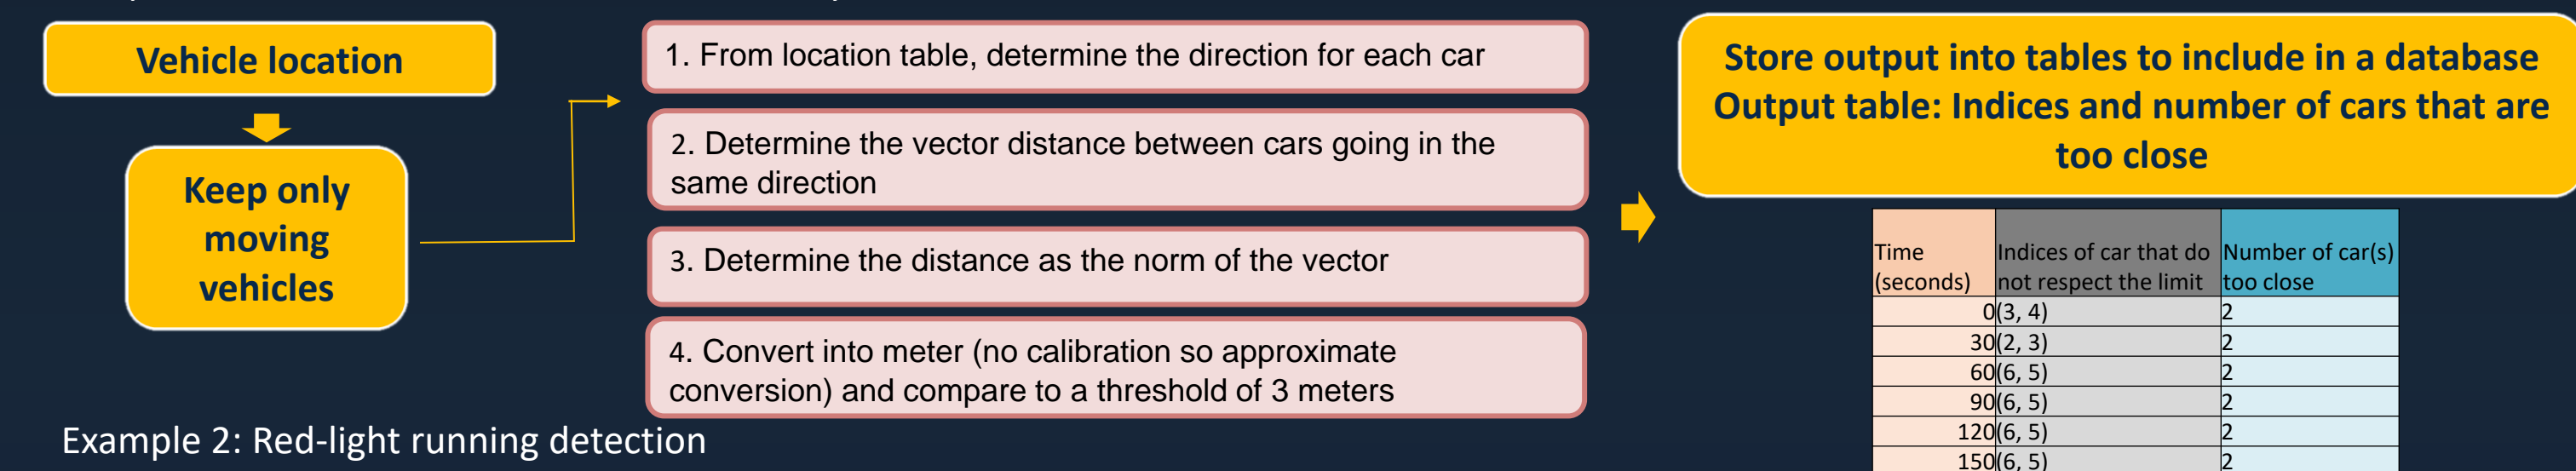

TRAFFIC AND PEDESTRIAN DATA ANALYSIS THROUGH DATA FUSION

Overview

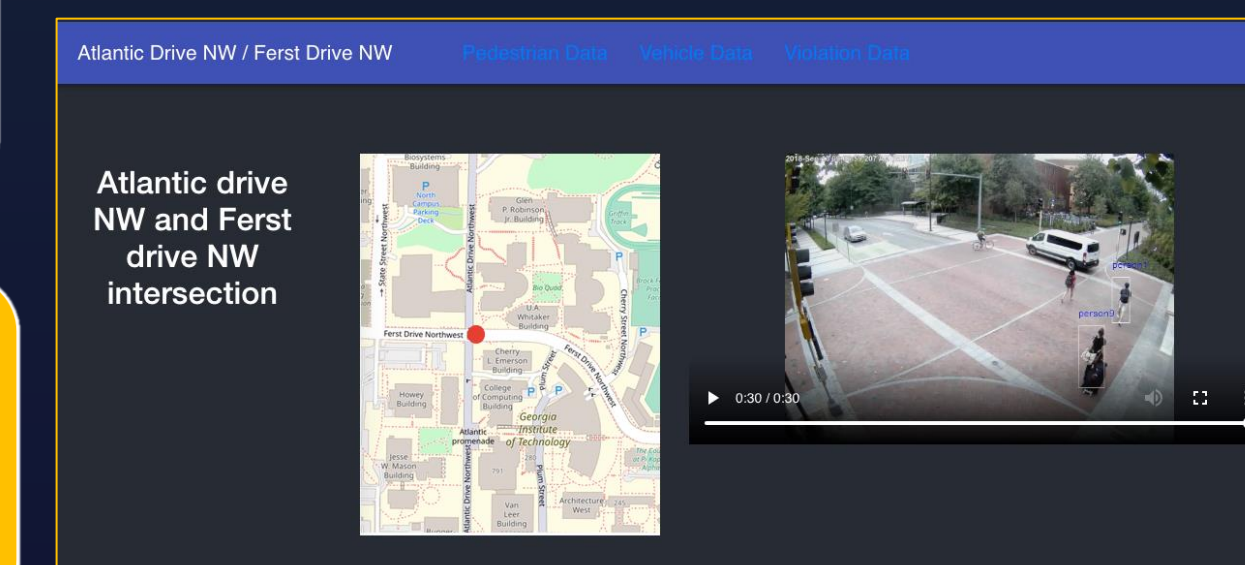

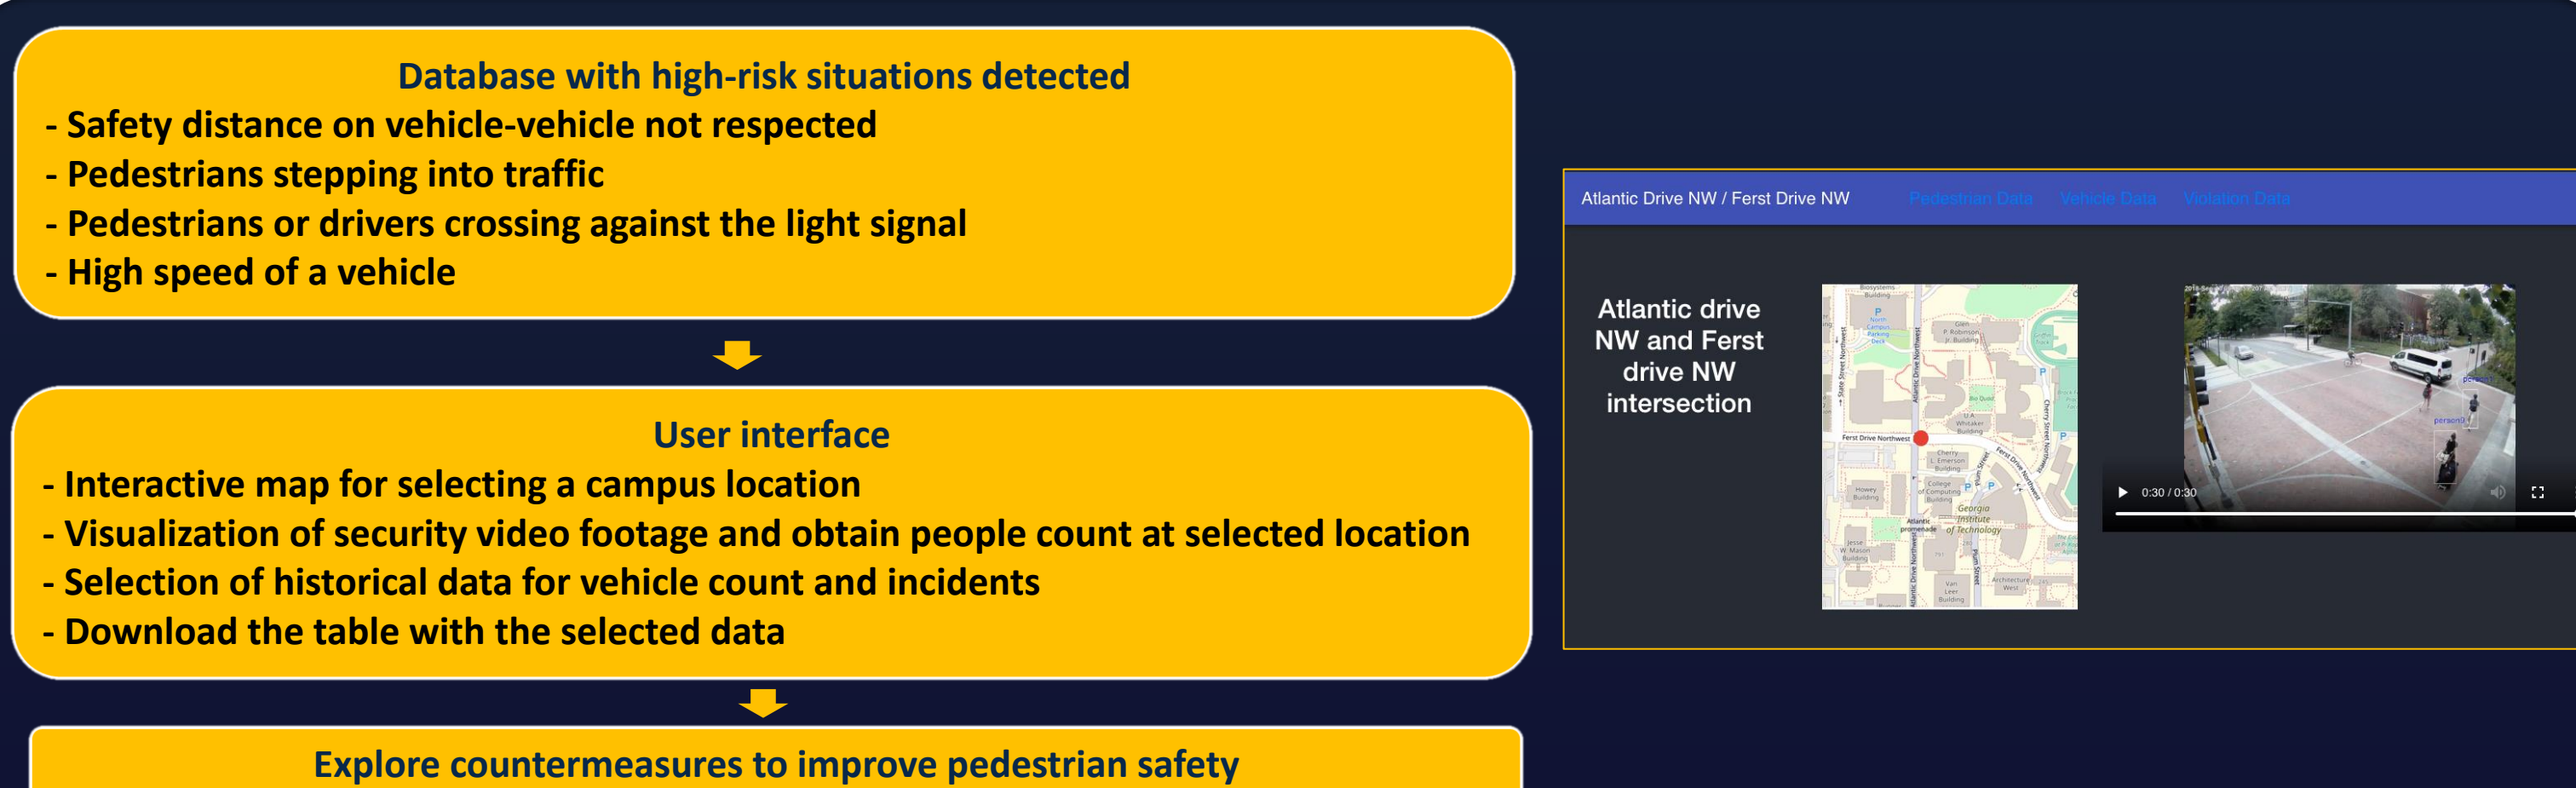

Example 1: Distance vehicle-vehicle below safety distance

Example 2: Red-light running detection

OUTPUT DATABASE AND USER INTERFACE

1. Centers for Disease Control and Prevention
